

**CONTEXT SENSITIVE TERM EXPANSION
WITH DYNAMIC TERM EXPANSION**

ABSTRACT OF THE DISCLOSURE

Methods, articles of manufacture, and systems for searching collections of data using context sensitive expanded term searching using dynamic term expansion are provided. The collection of data may be a relational database, text document, or any other type of searchable collection of data. In either case, a query including a search condition based on a specified search term may be modified to include additional conditions based on a set of expanded (e.g., conceptually-related) search terms dynamically linked with the query. For some embodiments, a user may be given the ability to choose whether the set of expanded search terms are dynamically linked with the query or not.
